5.2.2. Histogram of passenger information of Titanic

00:52 ⌵ 📄 📌 🔗 ⌵

Write a Python code to plot a histogram for the distribution of the 'Age' column from the Titanic dataset. The histogram should display the frequency of different age ranges with the following specifications:

1. Use **30 bins** for the histogram.
2. Set the **edge color** of the bars to **black (k)**.
3. Label the x-axis as **'Age'** and the y-axis as **'Frequency'**.
4. Add the title **"Age Distribution"** to the histogram.

The Titanic dataset contains columns as shown below,

PassengerId	Survived	Pclass	Name	Sex	Age	SibSp	Parch	Ticket	Fare	Cabin	Embarked

Sample Data:

```
PassengerId, Survived, Pclass, Name, Sex, Age, SibSp, Parch, Ticket, Fare, Cabin, Embarked
1,0,3,"Braund, Mr. Owen Harris",male,22,1,0,A/5 21171,7.25,,S
2,1,1,"Cumings, Mrs. John Bradley (Florence Briggs Thayer)",female,38,1,0,PC 17599,71.2833,C85,C
```

Test cases

### 1.1.2. Conditional Calculation Based on the Number of Digits

Write a Python program that accepts an integer  $n$  as input. Depending on the number of digits in  $n$ .

**Constraints:**  
 $1 \leq n \leq 999$

**Input Format:**  
The input consists of a single integer  $n$ .

**Output Format:**  
If  $n$  is a single-digit number, print its square.  
If  $n$  is a two-digit number, print its square root (rounded to two decimal places).  
If  $n$  is a three-digit number, print its cube root (rounded to two decimal places).  
Else print "Invalid".

Sample Test Cases

```
condition...
1
2 n = int(input())
3
4 if 1 <= n <= 9 :
5     print (f"{n**2}")
6
7 elif 10 <= n <= 99 :
8     print (f"{(n**(1/2)):.2f}")
9
10 elif 100 <= n <= 999 :
11     print (f"{(n**(1/3)):.2f}")
12
13 else :
14     print("Invalid")
```

5.2.3. Bar plot of survival rate of passengers 00.40

Write a Python code to plot a bar chart that shows the count of passengers who survived and did not survive in the Titanic dataset. The chart should display the following specifications:

1. Use the '**Survived**' column to show the count of survivors (0 = Did not survive, 1 = Survived).
2. Set the chart type to '**bar**'.
3. Add the title "**Survival Count**" to the chart.
4. Label the x-axis as '**Survived**' and the y-axis as '**Count**'.

The Titanic dataset contains columns as shown below,

PassengerId	Survived	Pclass	Name	Sex	Age	SibSp	Parch	Ticket	Fare	Cabin	Embarked

Sample Data:

```
PassengerId, Survived, Pclass, Name, Sex, Age, SibSp, Parch, Ticket, Fare, Cabin, Embarked
1,0,3,"Braund, Mr. Owen Harris",male,22,1,0,A/5 21171,7.25,,S
2,1,1,"Cumings, Mrs. John Bradley (Florence Briggs Thayer)",female,38,1,0,PC 17599,71.2833,C85,C
```

## 5.2.8. Box Plot for Age by Survived

Write a Python code to plot a boxplot that shows the distribution of the 'Age' column from the Titanic dataset based on whether passengers survived or not. The boxplot should display the following specifications:

1. Use the **Survived** column to group the data for the boxplot (0 = Did not survive, 1 = Survived).
2. Set the title of the plot to **"Age by Survival"**.
3. Remove the default subtitle with **plt.suptitle("")**.
4. Label the x-axis as **'Survived'** and the y-axis as **'Age'**.

The Titanic dataset contains columns as shown below,

| PassengerId | Survived | Pclass | Name | Sex | Age | SibSp | Parch | Ticket | Fare | Cabin | Embarked |
|-------------|----------|--------|------|-----|-----|-------|-------|--------|------|-------|----------|
|             |          |        |      |     |     |       |       |        |      |       |          |

### Sample Data:

```
PassengerId, Survived, Pclass, Name, Sex, Age, SibSp, Parch, Ticket, Fare, Cabin, Embarked

1.1.5. Multiplication Table

04:23

Write a Python program that takes an integer as input and prints the multiplication table for that integer from 1 to 10.

Input Format:

The first line of input contains an integer that represents the number for which the multiplication table is to be printed.

Output Format:

Print the multiplication table for the given number.

Sample Test Cases

multiplica...

Submit

1n = int(input())

2for i in range(1,11):

3print(f"{n} x {i} = {n \* i}")

Terminal

Test cases

The given code takes a list of integers as input and converts it into a NumPy array. Your task is to

- Creating a view of the original\_array and assigning it to view\_array.
- Creating a copy of the original\_array and assigning it to copy\_array.

- After completing these steps, observe how modifying the view affects the `original_array`, while

- A single line of space-separated integers.

- After modifying the view:

- After modifying the conv:

- ```
Original array after modifying copy: <original_array>
Copy array: <copy_array>
```

Sample Test Cases +

---

```
1 import numpy as np
```

### 4.1.1. Pandas - series creation and manipulation

00:38

Write a Python program that takes a list of numbers from the user, creates a Pandas series from it, and then calculates the mean of even and odd numbers separately using the **groupby** and **mean()** operations.

**Input Format:**

- The user should enter a list of numbers separated by space when prompted.

**Output Format:**

- The program should display the mean of even and odd numbers separately.
- Each mean value should be displayed with a label indicating whether it corresponds to even or odd numbers.

Sample Test Cases

```
1 import pandas as pd
2
3 # Take inputs from the user to create a list of numbers
4 numbers = list(map(int, input().split()))
5
6 # Create a Pandas series from the list of numbers
7 series = pd.Series(numbers)
8 # Grouping by even and odd numbers and calculating the mean
9 grouped = series.groupby(series%2==0).mean()
10 #grouped =
11
12 # Display the mean of even and odd numbers with labels
13 grouped.index = ['Even' if is_even else 'Odd' for is_even in
14 grouped.index]
15 print("Mean of even and odd numbers:")
16 print(grouped)
```

#### 4.2.1. Month with the Highest Total Sales

00:32

Write a Python program that takes the file name of a CSV file as input, reads the data, and performs the following operations:

- The CSV file contains the columns: Date, Product, Quantity, Price, and City.
- Group the data by Month and calculate the total sales for each month.
- Find the month with the highest total sales and display it.
- Also, display the total sales for the best month.

#### Sample Data:

```
Date,Product,Quantity,Price,City
2025-01-01,Product A,5,20,New York
2025-01-01,Product B,3,15,Los Angeles
2025-01-02,Product A,7,20,New York
2025-01-02,Product C,4,30,Chicago
2025-01-03,Product B,2,15,Chicago
2025-01-03,Product A,8,20,Los Angeles
2025-01-04,Product C,6,30,New York
2025-01-04,Product B,5,15,Los Angeles
2025-01-05,Product A,3,20,Chicago

## 4.2.6. Titanic Dataset Analysis and Data Cleaning - 2

You are provided with the Titanic dataset containing information about passengers on the Titanic. Your task is to write Python code to answer the following questions based on the dataset.

1. Create a new column 'IsAlone' which is 1 if the passenger is alone (FamilySize = 0), otherwise 0.
2. Convert the 'Sex' column to numeric values (male: 0, female: 1).
3. One-hot encode the 'Embarked' column, dropping the first category.
4. Get the mean age of passengers.
5. Get the median fare of passengers.
6. Get the number of passengers by class.
7. Get the number of passengers by gender.
8. Get the number of passengers by survival status.
9. Calculate the survival rate of passengers.
10. Calculate the survival rate by gender.

The Titanic dataset contains columns as shown below,

PassengerId	Survived	Pclass	Name	Sex	Age	SibSp	Parch	Ticket	Fare	Cabin	Embarked

Sample Test Cases +

## titanicDat...

```

1 import pandas as pd
2 import numpy as np
3
4 # Load the Titanic dataset
5 data = pd.read_csv('Titanic-Dataset.csv')
6 data['FamilySize'] = data['SibSp'] + data['Parch']
7
8 # 1. Create a new column 'IsAlone' (1 if alone, 0 otherwise)
9 data['IsAlone'] = np.where(data['FamilySize'] == 0, 1, 0)
10
11 # 2. Convert 'Sex' to numeric (male: 0, female: 1)
12 data['Sex'] = data['Sex'].map({'male': 0, 'female': 1})
13
14 # 3. One-hot encode the 'Embarked' column
15 data = pd.get_dummies(data, columns=['Embarked'], prefix='Embarked', drop_first=True)
16
17 # 4. Get the mean age of passengers
18 mean_age = data['Age'].mean()
19 print(mean_age)
20
21 # 5. Get the median fare of passengers
22 median_fare = data['Fare'].median()
23 print(median_fare)
24

```

```

### 3.2.2. Numpy: Horizontal and Vertical Stacking of Arrays

You are given two arrays `arr1` and `arr2`. You need to perform horizontal and vertical stacking operations on them using NumPy.

- **Horizontal Stacking:** Stack the two matrices horizontally (side by side).
- **Vertical Stacking:** Stack the two matrices vertically (one below the other).

**Input Format:**

- The program should first prompt the user to input two 3x3 arrays.
- Each array consists of 3 rows, and each row contains 3 space-separated integers.
- The user will input the two arrays row by row.

**Output Format:**

- The program should display the result of the Horizontal Stack (side-by-side stacking) of the two arrays.
- The program should then display the result of the Vertical Stack (one below the other) of the two arrays.

Sample Test Cases

```
stacking.py
1 import numpy as np
2
3 # Input matrices
4 print("Enter Array1:")
5 arr1 = np.array([list(map(int, input().split())) for i in range(3)])
6
7 print("Enter Array2:")
8 arr2 = np.array([list(map(int, input().split())) for i in range(3)])
9
10 # Perform horizontal stacking (hstack)
11
12 print("Horizontal Stack:")
13 print(np.hstack((arr1, arr2)))
14 # Perform vertical stacking (vstack)
15 print("Vertical Stack:")
16 print(np.vstack((arr1, arr2)))
17
```

1.1.4. Reverse a Number 04.1%

You are given an integer number. Your task is to reverse the digits of the number and print the reversed number.

**Input Format**  
The input is an integer.

**Output Format**  
Print a single integer which is the reversed number.

Sample Test Cases +

reverseN...

```
1 n = int(input())
2
3 r = int(str(n)[::-1])
4 print (r)
```

### 4.2.3. City that Sold the Most Products

Write a Python program that takes the file name of a CSV file as input, reads the data, and performs the following operations:

- The CSV file contains the columns: Date, Product, Quantity, Price, and City.
- Group the data by City and calculate the total quantity of products sold for each city.
- Find the city that sold the most products (based on the total quantity sold).

**Sample Data:**

```
Date,Product,Quantity,Price,City
2025-01-01,Product A,5,20,New York
2025-01-01,Product B,3,15,Los Angeles
2025-01-02,Product A,7,20,New York
2025-01-02,Product C,4,30,Chicago
2025-01-03,Product B,2,15,Chicago
2025-01-03,Product A,8,20,Los Angeles
2025-01-04,Product C,6,30,New York
2025-01-04,Product B,5,15,Los Angeles
2025-01-05,Product A,3,20,Chicago
2025-01-05,Product C,10,30,Los Angeles
```

**Note:**  
The data cannot be displayed in the file. You can refer to the sample data provided for insights.

Sample Test Cases

```
1 import pandas as pd
2
3 # Prompt the user for the file name
4 file_name = input()
5
6 # Load the data
7 df = pd.read_csv(file_name)
8
9 # write the code..
10 city_sales = df.groupby("City")["Quantity"].sum()
11 best_city = city_sales.idxmax()
12
13 # Display the result
14 print(f"City sold the most products: {best_city}")
15
```

### 2.1.2. Dictionary Operations

Write a Python program to perform the following dictionary operations:

- Create an empty dictionary and display it.
- Ask the user how many items to add, then input key-value pairs.
- Show the dictionary after adding items.
- Ask the user to update a key's value. Print "Value updated" if the key exists, otherwise print "Key not found".
- Retrieve and print a value using a key. If not found, print "Key not found".
- Use get() to retrieve a value. If the key doesn't exist, print "Key not found".
- Delete a key-value pair. If the key exists, delete and print "Deleted". If not, print "Key not found".
- Display the updated dictionary.

**Note:** Refer to visible test cases.

Sample Test Cases

```
dictOpera...
1 # 1. Create an empty dictionary and display it
2 my_dict = {}
3 print("Empty Dictionary:", my_dict)
4
5 # 2. Ask the user how many items to add, then input key-value pairs
6 #size =
7 #for _ in range(...):
8
9
10
11
12 # 3. Show the dictionary after adding items
13 #print("Dictionary:", my_dict)
14
15 # 4. Update a key's value
16 #key_to_update =
17
18
19
20 # 5. Retrieve and print a value using a key
21 #key_to_access =
22
23
24
25 # 6. Use 'get()' to retrieve a value
--
```

1.1.1. Calculate Momentum 15:30

Write a program that accepts the mass of an object (in kilograms) and its velocity (in meters per second), then calculates and displays the momentum of the object. The momentum  $p$  is calculated using the formula:

$$p = m \times v$$

where:  
 $m$  is the mass of the object (in kilograms).  
 $v$  is the velocity of the object (in meters per second).

**Input Format:**  
A single floating-point number representing the mass of the object in kilograms.  
A single floating-point number representing the velocity of the object in meters per second.

**Output Format:**  
The output will display calculated momentum with appropriate units (kgm/s) (rounded up to 2 decimal places).

Sample Test Cases

calculate... **Submit**

Explorer

1 m = float(input())  
2 v = float(input())  
3 p = m \* v  
4 print(f"{p:.2f}kgm/s")

### 2.1.1. List operations

Write a Python program that implements a menu-driven interface for managing a list of integers. The program should have the following menu options:

1. Add
2. Remove
3. Display
4. Quit

The program should repeatedly prompt the user to enter a choice from the menu. Depending on the choice selected, the program should perform the following actions:

- **Add:** Prompts the user to enter an integer and add it to the integer list. If the input is not a valid integer, display "Invalid input".
- **Remove:** Prompts the user to enter an integer to remove from the list. If the integer is found in the list, remove it; otherwise, display "Element not found". If the list is empty, display "List is empty".
- **Display:** Displays the current list of integers. If the list is empty, display "List is empty".
- **Quit:** Exits the program.
- The program should handle invalid menu choices by displaying "Invalid choice". Ensure that the program continues to prompt the user until they choose to quit (option 4).

Sample Test Cases +

```
listOps.py
1 menu = ["Add", "Remove", "Display", "Quit"]

### 1.1.3. Age and Salary Calculation

45:30

Write a Python program that reads the birth date and salary of employees.

**Input Format:**  
The input consists of:  
A string representing the birth date of the employee in the format *DD - MM - YYYY*.  
A floating-point number representing the salary of the employee in rupees.

**Output Format:**  
The output should include:  
The age of the employee.  
The salary of the employee in dollars.

**Note:**  
1INR=0.012USD

Sample Test Cases

```
birthDate... Submit
1 from datetime import datetime
2
3 def calculate_age(birthdate):
4     birthdate = datetime.strptime(birthdate, "%d-%m-%Y")
5     current_date = datetime.now()
6     age = current_date.year - birthdate.year - ((current_date.month,
7         current_date.day) < (birthdate.month, birthdate.day))
8     return age
9
10 def convert_salary_to_dollars(salary_in_rupees):
11     exchange_rate = 1/0.012
12     salary_in_dollars = salary_in_rupees / exchange_rate
13     return salary_in_dollars
14
15 birthdate = input()
16 salary_in_rupees = float(input())
17 age = calculate_age(birthdate)
18 salary_in_dollars = convert_salary_to_dollars(salary_in_rupees)
19 print(f"Age: {age}")
20 print(f"Salary in dollars: {salary_in_dollars:.2f}")
```

Terminal Test cases

### 4.2.4. Most Frequently Sold Product Pairs

Write a Python program that takes the file name of a CSV file as input, reads the data, and performs the following operations:

- The CSV file contains the following columns: Date, Product, Quantity, Price, and City.
- For each date, find all pairs of products that were sold together (i.e., two products sold on the same date).
- Output the product pair/s that was sold most frequently.

**Sample Data:**

Date	Product	Quantity	Price	City
2025-01-01	Product A	5	20	New York
2025-01-01	Product B	3	15	Los Angeles
2025-01-02	Product A	7	20	New York
2025-01-02	Product C	4	30	Chicago
2025-01-03	Product B	2	15	Chicago
2025-01-03	Product A	8	20	Los Angeles
2025-01-04	Product C	6	30	New York
2025-01-04	Product B	5	15	Los Angeles
2025-01-05	Product A	3	20	Chicago
2025-01-05	Product C	10	30	Los Angeles

**Explanation:**

**Transactions:**

Sample Test Cases

```
1 import pandas as pd
2 from itertools import combinations
3 from collections import Counter
4
5 # Prompt user to input the file name
6 file_name = input()
7
8 # Read data from the specified CSV file
9 df = pd.read_csv(file_name)
10
11 # write the code
12 grouped = df.groupby("Date")["Product"].apply(list)
13
14 product_pair = []
15 for products in grouped:
16     if len(products) > 1:
17         product_pair.extend(combinations(sorted(products), 2))
18
19 pair_counts = Counter(product_pair)
20
21 if pair_counts:
22     max_count = max(pair_counts.values())
23     most_common_pairs = [pair for pair, count in pair_counts.items() if count == max_count]
24     for pair in sorted(most_common_pairs):
```

1.2.3. Pattern - 1

10:35

🔍 🌙 📄 🔗 -

Write a Python program to print a pattern of asterisks in the form of a right-angled triangle.

**Input Format:**  
The input is an integer, representing the number of rows in the pattern.

**Output Format**  
The output should display the pattern of asterisks (\*), with each row containing an increasing number of asterisks.

**Note:**  
Refer to the displayed test cases for the sample pattern.

Sample Test Cases +

rightangl...

Submit

Debugger

1 n=int(input())

2.2.2. Captain of the Team 00:41 ⚙️ 🌙 ✎️ 🔗 -

You are provided with the heights of 11 cricket players (in centimeters). Your task is to identify the tallest player, who will be selected as the captain of the team.

**Input Format:**  
The first line of input will contain 11 integers, each representing the height of a player (in centimeters), each separated by a space.

**Output Format**  
The output should be the height (in centimeters) of the tallest player.

Sample Test Cases +

### 1.2.1. Pass or Fail

Write a Python program that accepts the number of courses and the marks of a student in those courses.

The grade is determined based on the aggregate percentage:

- If the aggregate percentage is greater than 75, the grade is Distinction.
- If the aggregate percentage is greater than or equal to 60 but less than 75, the grade is First Division.
- If the aggregate percentage is greater than or equal to 50 but less than 60, the grade is Second Division.
- If the aggregate percentage is greater than or equal to 40 but less than 50, the grade is Third Division.

**Input Format:**

The first input will be an integer  $n$ , the number of courses.

The second input will be  $n$  integers representing the marks of the student in each of the  $n$  courses, separated by a space.

**Output Format:**

If the student passes all courses:

- Print the aggregate percentage (rounded to two decimal places).
- Print the grade based on the aggregate percentage.

If the student fails any course (marks < 40 in any course), print:

Sample Test Cases

```
passorFa... Submit
1 a = int(input())
2 b = list(map(int,input().split()))
3 if any(b<40 for b in b):
4     print("Fail")
5 else:
6     c=(sum(b)/(a*100))*100
7     print(str(("Aggregate Percentage: ")+"{c:.2f}"))
8     if c>75:
9         print("Grade: Distinction")
10    elif 60<=c<=75:
11        print("Grade: First Division")
12    elif 50<=c<60:
13        print("Grade: Second Division")
14    elif 40<=c<50:
15        print("Grade: Third Division")
```

You are given two arrays A and B. Your task is to complete the function `array_operations`, which

```
def array_operations(A, B):
```

- Compute the element-wise sum, difference, and product of the two arrays.

- ### 3. Bitwise Operations:

```
11 prod_result = a*b
```

- ```
15 median_A = np.median(a)
```

- For each operation (arithmetic, statistical, and bitwise), print the results in the specified format as

- ```
19 and_result = np.bitwise_and(a,b)
20 or_result = np.bitwise_or(a,b)
```

Sample Test Cases	<pre> 24 print("Element-wise Sum:", ' '.join(map(str, sum_result))) 25 print("Element-wise Difference:", ' '.join(map(str, diff_result))) </pre>
-------------------	--

5.2.11. Scatter Plot for Age vs. Fare by Survived 00:47

Write a Python code to plot a scatter plot showing the relationship between the 'Age' and 'Fare' columns in the Titanic dataset, with points color-coded by survival status. The scatter plot should display the following specifications:

1. Use the **Age** column for the x-axis and the **Fare** column for the y-axis.

2. Color the points based on the **Survived** column: **Red** for passengers who did not survive (**Survived = 0**). **Blue** for passengers who survived (**Survived = 1**).

3. Set the title of the plot to "**Age vs. Fare by Survival**".

4. Label the x-axis as '**Age**' and the y-axis as '**Fare**'.

The Titanic dataset contains columns as shown below,

PassengerId	Survived	Pclass	Name	Sex	Age	SibSp	Parch	Ticket	Fare	Cabin	Embarked

Sample Data:

PassengerId, Survived, Pclass, Name, Sex, Age, SibSp, Parch, Ticket, Fare, Cabin, Embarked

### 4.1.3. Student Information

Write a program to read a text file containing student information (name, age, and grade) using Pandas. Perform the following tasks:

- Display the first five rows of the data frame.
- Calculate the average age of the students(limit the average age up to 2 decimal places).
- Filter out the students who have a grade above a certain threshold(consider the threshold grade is 'B').

**Note:**  
Refer to the displayed test cases for better understanding.

Sample Test Cases

```
1 import pandas as pd
2
3 # Read the text file into a DataFrame
4 file = input()
5 data = pd.read_csv(file, sep="\s+", header=None, names=["Name", "Age",
6 "Grade"])
7
8 # write your code here..
9 print("First five rows:")
10 print(data.head())
11
12 avg_age = round(data["Age"].mean(),2)
13 print(f"Average age: {avg_age}")
14
15 print("Students with a grade up to B")
16
17 filtered_student = data[data["Grade"] <= "B"]
18 print(filtered_student)
```

5.2.5. Bar Plot for Survival by Pclass

Write a Python code to plot a stacked bar chart that shows the count of passengers who survived and did not survive, grouped by passenger class (**Pclass**), in the Titanic dataset. The chart should display the following specifications:

1. Group the data by the **Pclass** column and count the number of survivors (0 = Did not survive, 1 = Survived) for each class using **value\_counts()**.

2. Use a **stacked bar chart** to display the survival counts.

3. Add the title **"Survival by Pclass"** to the chart.

4. Label the x-axis as **'Pclass'** and the y-axis as **'Count'**.

5. The legend should indicate **'Not Survived'** and **'Survived'**.

The Titanic dataset contains columns as shown below,

Pas sen ger id	Sur vive d	Pcla ss	Na me	Sex	Age	Sib Sp	Par ch	Tick et	Far e	Cab in	Em bark ed

Sample Data:

Test cases

5.2.9. Box Plot for Fare by Pclass 00:56

Write a Python code to plot a boxplot that shows the distribution of the 'Fare' column from the Titanic dataset based on the passenger class (Pclass). The boxplot should display the following specifications:

- Use the **Pclass** column to group the data for the boxplot.
- Set the title of the plot to **"Fare by Pclass"**.
- Remove the default subtitle with **plt.suptitle("")**.
- Label the x-axis as **'Pclass'** and the y-axis as **'Fare'**.

The Titanic dataset contains columns as shown below,

PassengerId	Survived	Pclass	Name	Sex	Age	SibSp	Parch	Ticket	Fare	Cabin	Embarked

Sample Data:

```
PassengerId, Survived, Pclass, Name, Sex, Age, SibSp, Parch, Ticket, Fare, Cabin, Embarked
1, 0, 3, "Braund, Mr. Owen Harris", male, 22, 1, 0, A/5 21171, 7.25, , 5
2, 1, 1, "Cumings, Mrs. John Bradley (Florence Briggs Thayer)", female, 38, 1, 0, PC 17599, 71.2833, C85, C
```

### 3.2.7. Student Data Analysis and Operations

Write a Python program that takes the file name of a CSV file containing student details, including roll numbers and their marks in three subjects as input, reads the data, and performs the following operations:

- **Print all student details:** Display the complete details of all students, including roll numbers and marks for all subjects.
- **Find total students:** Determine the total number of students in the dataset.
- **Print all student roll numbers:** Extract and print the roll numbers of all students.
- **Print Subject 1 marks:** Extract and print the marks of all students in Subject 1.
- **Find minimum marks in Subject 2:** Identify the lowest marks in Subject 2.
- **Find maximum marks in Subject 3:** Identify the highest marks in Subject 3.
- **Print all subject marks:** Display the marks of all students for each subject.
- **Find total marks of students:** Compute the total marks for each student across all subjects.
- **Find the average marks of each student:** Compute the average marks for each student.
- **Find average marks of each subject:** Compute the average marks for all students in each subject.
- **Find average marks of Subject 1 and Subject 2:** Compute the average marks for Subject 1 and Subject 2.
- **Find average marks of Subject 1 and Subject 3:** Compute the average marks for Subject 1 and Subject 3.
- **Find the roll number of the student with maximum marks in Subject 3:** Identify the student with the highest marks in Subject 3 and print their roll number.

Sample Test Cases +

### Operation...

```
1 import numpy as np
2
3 a = np.loadtxt("Sample.csv", delimiter=',', skiprows=1)
4
5 # 1. Print all student details
6 print("All student Details:\n", a)
7
8 # 2. print total students
9 r,c=a.shape
10 print("Total Students:", r)
11
12 # 3. Print all student Roll numbers
13 print("All Student Roll Nos", a[:,0])
14
15 # 4. Print subject 1 marks
16 print("Subject 1 Marks", a[:,1])
17
18 # 5. print minimum marks of Subject 2
19 print("Min marks in Subject 2", np.min(a[:,2]))
20
21 # 6. print maximum marks of Subject 3
22 print("Max marks in Subject 3", np.max(a[:,3]))
23
24 # 7. Print All subject marks
25 print("All subject marks:", a[:,1:])
--
```

Terminal Test cases

instructions:

The dataset is stored in a CSV file named `titanic.csv` and has been loaded using the `pandas`

- **Pclass:** Passenger class (1 = First, 2 = Second, 3 = Third).
- **Gender:** Gender of the passenger (male/female).

To represent these trends, you will create 5 visualizations using Matplotlib. The visualizations should

Write the code to create a series of visualizations as follows:

### 4.2.7. Titanic Dataset Analysis and Data Cleaning - 3

You are provided with the Titanic dataset containing information about passengers on the Titanic. Your task is to write Python code to answer the following questions based on the dataset.

1. Calculate the survival rate by class.
2. Calculate the survival rate by embarkation location (Embarked\_S).
3. Calculate the survival rate by family size (FamilySize).
4. Calculate the survival rate by being alone (IsAlone).
5. Get the average fare by passenger class (Pclass).
6. Get the average age by passenger class (Pclass).
7. Get the average age by survival status (Survived).
8. Get the average fare by survival status (Survived).
9. Get the number of survivors by class (Pclass).
10. Get the number of non-survivors by class (Pclass).

The Titanic dataset contains columns as shown below,

PassengerId	Survived	Pclass	Name	Sex	Age	SibSp	Parch	Ticket	Fare	Cabin	Embarked

Sample Test Cases +

```
1 import pandas as pd
2 import numpy as np
3
4 # Load the Titanic dataset
5 data = pd.read_csv('Titanic-Dataset.csv')
6 data['FamilySize'] = data['SibSp'] + data['Parch']
7 data['IsAlone'] = np.where(data['FamilySize'] > 0, 0, 1)
8 data = pd.get_dummies(data, columns=['Embarked'], drop_first=True)
9
10 data['Embarked_S'] = (data['Embarked_S'] if 'Embarked_S' in data.columns
11 else (data['Embarked'] == 'S').astype(int))
12 # 1. Calculate the survival rate by class
13 print(data.groupby('Pclass')['Survived'].mean())
14
15 # 2. Calculate the survival rate by embarked location
16 #print("Embarked_S")
17 print(data.groupby('Embarked_S')['Survived'].mean())
18
19 # 3. Calculate the survival rate by family size
20 srf = data.groupby('FamilySize')['Survived'].mean()
21 print(srf)
22
23 # 4. Calculate the survival rate by being alone
24 sra = data.groupby('IsAlone')['Survived'].mean()
25 print(sra)
26 --
```

### 3.2.1. Numpy: Matrix Operations

The given code takes two  $3 \times 3$  matrices, `matrix_a`, and `matrix_b`, as input from the user and converts them into NumPy arrays.

**Task:**

You are required to compute and display the results of the following matrix operations:

1. **Addition** (`matrix_a + matrix_b`)
2. **Subtraction** (`matrix_a - matrix_b`)
3. **Element-wise Multiplication** (`matrix_a * matrix_b`)
4. **Matrix Multiplication** (`matrix_a · matrix_b`)
5. **Transpose of Matrix A**

**Input Format:**

- The user will input 3 rows for `matrix_a`, each containing 3 integers separated by spaces.
- Similarly, the user will input 3 rows for `matrix_b`, each containing 3 integers separated by spaces.

**Output Format:**

The program should display the results of the operations in the following order:

1. The result of Addition.
2. The result of Subtraction.
3. The result of Element-wise Multiplication.
4. The result of Matrix Multiplication.
5. The result of Transpose of Matrix A.

Sample Test Cases

```
1 import numpy as np
2
3 # Input matrices
4 print("Enter Matrix A:")
5 matrix_a = np.array([list(map(int, input().split())) for i in range(3)])
6
7 print("Enter Matrix B:")
8 matrix_b = np.array([list(map(int, input().split())) for i in range(3)])
9
10
11 # Addition
12 #print("Addition (A + B):")
13
14 # Subtraction
15 #print("Subtraction (A - B):")
16
17 # Multiplication (element-wise)
18 #print("Element-wise Multiplication (A * B):")
19
20 # Matrix multiplication (dot product)
21 #print("A dot B:")
22
23 # Transpose
24 #print("Transpose of A:")
25 # Addition
```

### 4.2.2. Best Selling Product

Write a Python program that takes the file name of a CSV file as input, reads the data, and performs the following operations:

- The CSV file contains the columns: Date, Product, Quantity, Price, and City.
- Find the product that sold the most in terms of quantity sold.
- Display the product that sold the most and the total quantity sold for that product.

**Sample Data:**

Date	Product	Quantity	Price	City
2025-01-01	Product A	5	20	New York
2025-01-01	Product B	3	15	Los Angeles
2025-01-02	Product A	7	20	New York
2025-01-02	Product C	4	30	Chicago
2025-01-03	Product B	2	15	Chicago
2025-01-03	Product A	8	20	Los Angeles
2025-01-04	Product C	6	30	New York
2025-01-04	Product B	5	15	Los Angeles
2025-01-05	Product A	3	20	Chicago
2025-01-05	Product C	10	30	Los Angeles

**Note:**  
The data cannot be displayed in the file. You can refer to the sample data provided for insights.

Sample Test Cases

```
1 import pandas as pd
2
3 # Prompt the user for the file name
4 file_name = input()
5
6 # Load the data
7 df = pd.read_csv(file_name)
8
9
10 # Find the product with the highest total quantity sold
11 product_sales = df.groupby("Product")["Quantity"].sum()
12 best_product = product_sales.idxmax()
13 highest_quantity = product_sales.max()
14
15 # Display the result
16 print(f"Best selling product: {best_product}")
17 print(f"Total quantity sold: {highest_quantity}")
18
```

### 1.2.2. Fibonacci series using Recursive Function

Write a Python program to find the Fibonacci series of a given number of terms using recursive function calls.

**Expected Output-1:**  
Enter terms for Fibonacci series: 5  
0 1 1 2 3

**Expected Output-2:**  
Enter terms for Fibonacci series: 9  
0 1 1 2 3 5 8 13 21

**Instructions:**

- Your input and output must follow the input and output layout mentioned in the visible sample test case.
- Hidden test cases will only pass when users' input and output match the expected input and output.

Sample Test Cases

### fib.py

```
1 def fib(n):
2     if n<=1 :
3         return n
4     return fib(n-1)+fib(n-2)
5 n=int(input("Enter terms for Fibonacci series: "))
6 for i in range (n):
7     print(fib(i),end=" ")
```

Terminal Test cases

### 3.2.6. Numpy: Searching, Sorting, Counting, Broadcasting

The given code in the editor takes a single array, `array1`, as space-separated integers as input from the user.

Additionally, it takes the following inputs:

- `search_value`: The value to search for in the array.
- `count_value`: The value to count its occurrences in the array.
- `broadcast_value`: The value to add for broadcasting across the array.

You need to complete the code to perform the following operations:

1. **Searching**: Find the indices where `search_value` appears in `array1` and print these indices.
2. **Counting**: Count how many times `count_value` appears in `array1` and print the count.
3. **Broadcasting**: Add `broadcast_value` to each element of `array1` using broadcasting, and print the resulting array.
4. **Sorting**: Sort `array1` in ascending order and print the sorted array.

**Input Format:**

1. A single line containing space-separated integers representing `array1`.
2. An integer `search_value` represents the value to search for in the array.
3. An integer `count_value` represents the value to count in the array.
4. An integer `broadcast_value` represents the value to add to each element of the array.

Sample Test Cases +

```
arrayOpe... Submit
1 import numpy as np
2
3 # Input array from the user
4 array1 = np.array(list(map(int, input().split()))))
5
6 # Searching
7 search_value = int(input("Value to search: "))
8 count_value = int(input("Value to count: "))
9 broadcast_value = int(input("Value to add: "))
10
11 # Find indices where value matches in array1
12 a=np.where(array1==search_value)
13 print(a[0])
14 # Count occurrences in array1
15 b=np.count_nonzero(array1==count_value)
16 print(b)
17 # Broadcasting addition
18 c=array1+broadcast_value
19 print(c)
20 # Sort the first array
21 d=np.sort(array1)
22 print(d)
```

### 4.1.2. Dictionary to dataframe

A dictionary of lists has been provided to you in the editor. Create a DataFrame from the dictionary of lists and perform the listed operations, then display the DataFrame before and after each manipulation.

**Create the DataFrame:**

- Convert the dictionary to a Pandas DataFrame.

**Add a new row:**

- Take inputs from the user for the new row data (name, age).
- Add the new row to the DataFrame.
- Display the DataFrame after adding the new row.

**Modify a row:**

- Modify a specific row by changing the age. Take the row index and new age value from the user.
- Display the DataFrame after modifying the row.

**Delete a row:**

- Take the row index to be deleted from the user.
- Remove the specified row.
- Display the DataFrame after deleting the row.

**Add a new column:**

Sample Test Cases +

```
1 import pandas as pd
2
3 # Provided dictionary of lists
4 data = {
5     'Name': ['Alice', 'Bob', 'Charlie'],
6     'Age': [25, 30, 35],
7 }
8
9 # Convert the dictionary to a DataFrame
10 df = pd.DataFrame(data)
11
12 # Display the original DataFrame
13 print("Original DataFrame:")
14 print(df)
15
16 # Adding a new row
17 name = input("New name: ")
18 age = int(input("New age: "))
19 new_row = {"Name": name, "Age": age}
20 df = df.append(new_row, ignore_index = True)
21
22 # Display the DataFrame after adding a new row
23 print("After adding a row:\n",df)
24
25 # Modifying a row
```

### 3.1.1. Numpy array operations

Write a python program to demonstrate the usage of ndim, shape and size for a Numpy Array. The program should create a NumPy array using the entered elements and display it. Assume all input elements are valid numeric values.

**Input Format:**

- User inputs the number of rows and columns with space separated values.
- User inputs elements of the array row-wise followed line by line, separated by spaces.

**Output Format:**

- The created NumPy array based on the input dimensions and elements.
- Dimensions (ndim): Number of dimensions of the array.
- Shape: Tuple representing the shape of the array (number of rows, number of columns).
- Size: Total number of elements in the array.

**Note:** Use reshape() function to reshape the input array with the specified number of rows and columns.

Sample Test Cases +

```
1 import numpy as np
2 def main():
3     rows, cols = map(int, input().split())
4     elements = []
5     for _ in range(rows):
6         elements.extend(map(int, input().split()))
7
8     array = np.array(elements)
9     array = array.reshape(rows, cols)
10    print(array)
11    print(array.ndim)
12    print(array.shape)
13    print(array.size)
14 if __name__ == "__main__":
15     main()
16
```

5.2.7. Box plot for Age Distribution 00:56

Write a Python code to plot a boxplot that shows the distribution of the 'Age' column from the Titanic dataset across different passenger classes. The boxplot should display the following specifications:

- Use the **Pclass** column to group the data for the boxplot.
- Set the title of the plot to **"Age by Pclass"**.
- Remove the default subtitle with **plt.suptitle("")**.
- Label the x-axis as **'Pclass'** and the y-axis as **'Age'**.

The Titanic dataset contains columns as shown below,

PassengerId	Survived	Pclass	Name	Sex	Age	SibSp	Parch	Ticket	Fare	Cabin	Embarked

Sample Data:

```
PassengerId, Survived, Pclass, Name, Sex, Age, SibSp, Parch, Ticket, Fare, Cabin, Embarked
1,0,3,"Braund, Mr. Owen Harris",male,22,1,0,A/5 21171,7.25,,S
2,1,1,"Cumings, Mrs. John Bradley (Florence Briggs Thayer)",female,38,1,0,PC 17599,71.2833,C85,C
```

Sample Test Cases +

BoxPlotF... Submit

```
1 import pandas as pd
2 import matplotlib.pyplot as plt
3
4 # Load the Titanic dataset
5 data = pd.read_csv('Titanic-Dataset.csv')
6
7 # Data Cleaning
8 data['Age'].fillna(data['Age'].median(), inplace=True)
9 data['Embarked'].fillna(data['Embarked'].mode()[0], inplace=True)
10 data.drop('Cabin', axis=1, inplace=True)
11
12 # Convert categorical features to numeric
13 data['Sex'] = data['Sex'].map({'male': 0, 'female': 1})
14 data = pd.get_dummies(data, columns=['Embarked'], drop_first=True)
15
16 # Write your code here for Box Plot for Age by Pclass
17 plt.figure(figsize=(8,6))
18 data.boxplot(column='Age',by='Pclass')
19 plt.title('Age by Pclass')
20 plt.suptitle('')
21 plt.xlabel('Pclass')
22 plt.ylabel('Count')
23 plt.show()
24
25
```

Terminal Test cases

### 4.2.8. Titanic Dataset Analysis and Data Cleaning - 4

You are provided with the Titanic dataset containing information about passengers on the Titanic. Your task is to write Python code to answer the following questions based on the dataset.

1. Get the number of survivors by gender (Sex).
2. Get the number of non-survivors by gender (Sex).
3. Get the number of survivors by embarkation location (Embarked\_S).
4. Get the number of non-survivors by embarkation location (Embarked\_S).
5. Calculate the percentage of children (Age < 18) who survived.
6. Calculate the percentage of adults (Age >= 18) who survived.
7. Get the median age of survivors.
8. Get the median age of non-survivors.
9. Get the median fare of survivors.
10. Get the median fare of non-survivors.

The Titanic dataset contains columns as shown below,

PassengerId	Survived	Pclass	Name	Sex	Age	SibSp	ParCh	Ticket	Fare	Cabin	Embarked

Sample Test Cases +

```
1 import pandas as pd
2 import numpy as np
3
4 # Load the Titanic dataset
5 data = pd.read_csv('Titanic-Dataset.csv')
6 data = pd.get_dummies(data, columns=['Embarked'], drop_first=True)
7
8
9 # 1. Get the number of survivors by gender
10 print(data[data['Survived']==1]['Sex'].value_counts())
11
12 # 2. Get the number of non-survivors by gender
13 print(data[data['Survived']==0]['Sex'].value_counts())
14
15 # 3. Get the number of survivors by embarked location
16 print(data[data['Survived']==1]
17       ['Embarked_S'].value_counts())
18
19 # 4. Get the number of non-survivors by embarked location
20 print(data[data['Survived']==0]
21       ['Embarked_S'].value_counts())
22
23 # 5. Calculate the percentage of children (Age < 18) who survived
24 print(data[data['Age']<18]['Survived'].mean())
25
```

5.2.6. Bar Plot for Survival by Embarked

00:48

Write a Python code to plot a stacked bar chart showing the survival count for passengers based on their embarkation location in the Titanic dataset.

The chart should display the following specifications:

1. Use the **Embarked** column to determine the embarkation location. After converting this column into dummy variables (using **pd.get\_dummies()**), plot the survival count based on the **Embarked\_Q** column (representing passengers who embarked from Queenstown) in relation to survival.
2. Set the chart type to 'bar' and make it stacked.
3. Add the title "**Survival by Embarked** " to the chart.
4. Label the x-axis as '**Embarked**' and the y-axis as '**Count**'.
5. Include a legend to distinguish between survivors and non-survivors (label the legend as '**Survived**' and '**Not Survived**').

The Titanic dataset contains columns as shown below,

Pas sen ger id	Sur vive d	Pcla ss	Na me	Sex	Age	Sib Sp	Par ch	Tick et	Fare	Cab in	Em bark ed

### 5.1.1. Stacked Plot

Create a stacked area plot to visualize the temperature variations for three different cities (City A, City B, and City C) across the months of the year. The temperature data is provided for each city in the editor.

Your task is to:

- Create a stacked area plot using the data.
- Label the x-axis as "Month", the y-axis as "Temperature", and provide the title "Temperature Variation" for the plot.
- Display the plot showing the temperature variation for each city throughout the months of the year.

Sample Test Cases

```
1 import matplotlib.pyplot as plt
2 import pandas as pd
3
4 # Data for Months and Temperature for three cities
5 data = {
6     'Month': ['January', 'February', 'March', 'April', 'May', 'June',
7             'July', 'August', 'September', 'October', 'November', 'December'],
8     'City_A_Temperature': [5, 7, 10, 13, 17, 20, 22, 21, 18, 12, 8, 6],
9     'City_B_Temperature': [2, 3, 5, 6, 10, 14, 16, 17, 12, 9, 5, 3],
10    'City_C_Temperature': [3, 4, 6, 8, 9, 12, 15, 14, 10, 7, 4, 2]
11 }
12
13 # Write your code...
14 df = pd.DataFrame(data)
15
16 plt.figure()
17 plt.stackplot(df['Month'], df['City_A_Temperature'], df['City_B_Temperature'],
18             df['City_C_Temperature'],
19             labels = ['City A', 'City B', 'City C'], alpha=1)
20
21 plt.xlabel("Month")
22 plt.ylabel("Temperature")
23 plt.title("Temperature Variation")
24
25 plt.show()
```
